

LIVE · ON-CHAIN · WORLD CUP 2026

Called It

A live, on-chain-verified FIFA World Cup 2026 prediction game on Solana — the thrill of a casual bet, made provable and trustless.

Solana World Cup 2026 Hackathon — Demo Day · July 2026 · called-it.netlify.app

THE MOMENT WE LIVE FOR

Billions watch. Millions want in on the outcome.

Every match is a stream of **moments people would bet on** — but the tools to do it are either untrustworthy or too slow.

—
5B+

people expected to engage with FIFA World Cup
2026

48 teams · 104 matches · one global live
audience

—
\$1T+

wagered on sports every year — mostly through
houses you must trust

THE PROBLEM

Three ways to bet on a live moment — each broken in its own way.

Bets you must trust a house

Traditional bookmakers are live, but centralized and opaque. You never see the true odds, the settlement, or the money. You just have to trust them.

Post-hoc markets aren't live

On-chain prediction markets are provable — but they resolve after the fact. By the time a market settles, the moment you cared about is long gone.

Casual apps have no stakes

“Guess the score” social apps are fun and instant, but there's no real stake and no proof. Nothing is on the line, so nothing is really at stake.

Two fans, one unmet need.

The casual fan

Watches every match with friends. Loves the rush of calling the next goal out loud. Would happily put a small stake on it — if it were quick, fun, and mobile.

"I called that corner — now let me actually cash it in."

The skeptic

Enjoys a bet but refuses to trust a black-box house. Wants to see the odds, the stake, and the settlement. If it's not verifiable, they're out.

"Don't tell me I won. Show me on-chain."

THE SOLUTION

Called It — call live, stamp on-chain, settle provably.

1

Call it live

During the match, call what happens next — next goal, corner or card — before it resolves. Instant, mobile, in the moment.

2

Stamped on-chain

Your call is a real devnet SOL stake, verified on Solana by the backend and stamped with the transaction hash and block time.

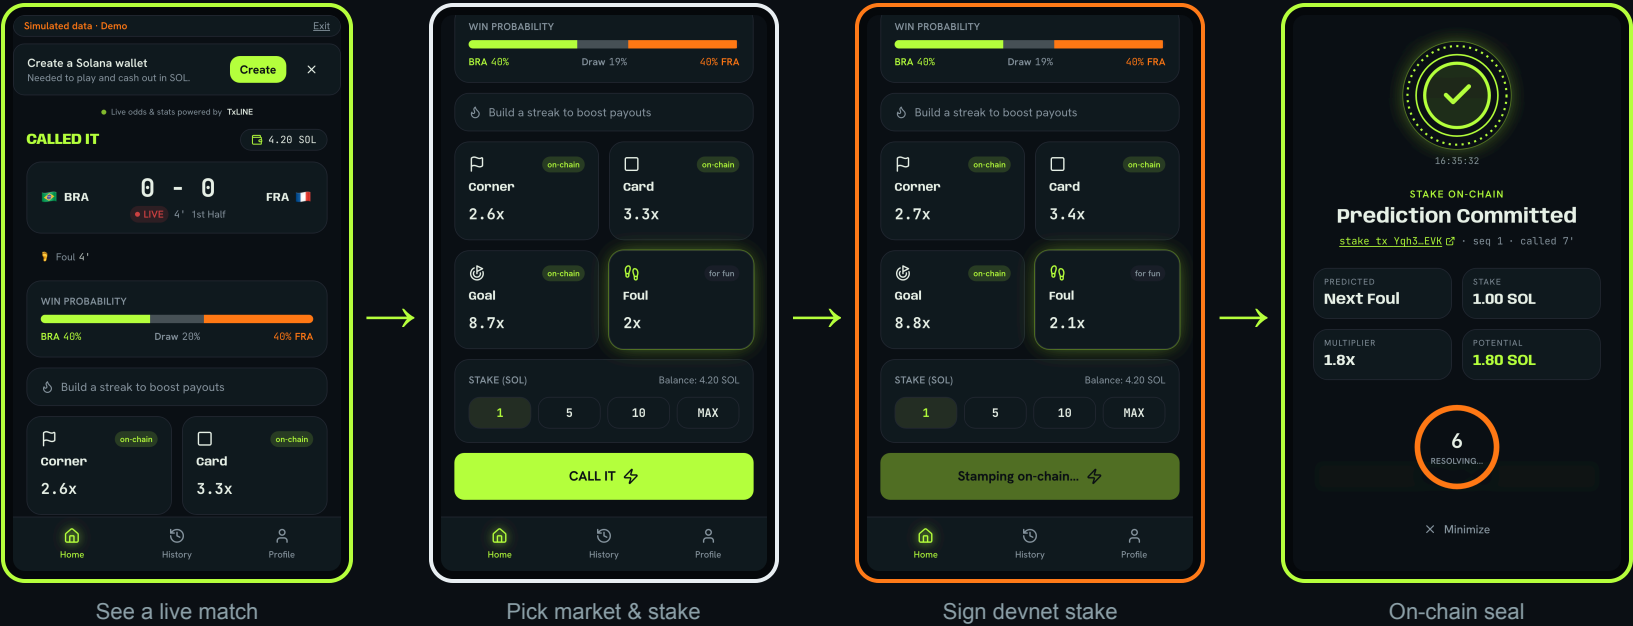

3

Settled & paid provably

A settlement worker resolves the market off the live feed. Called it → paid in SOL by a real transfer. No house, no dispute.

HOW IT WORKS

From tap to payout — six steps, one live loop.

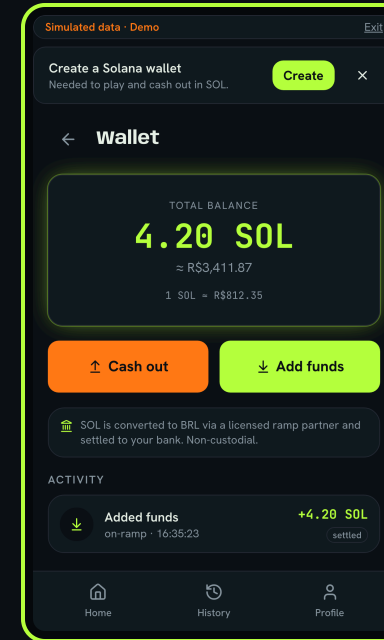

THE DIFFERENTIATOR

Validated against the live feed. Proven on-chain.

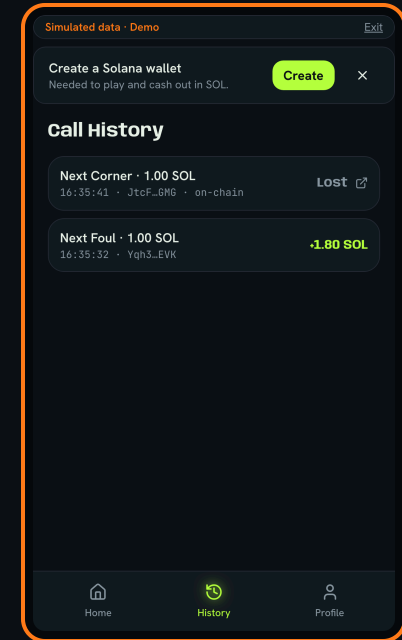

Called It is the only experience that is **both live and trustless**.

- **Live / instant** — You call during the match, before the event resolves — not a post-hoc market.
- **On-chain provable** — Real stake and settlement, verifiable on Solana. No house you have to trust.
- **Feed-validated** — Provable markets settle off the TxODDS live feed and are cross-checked on-chain via the TxOracle validate_stat program.

“You call it — the chain proves it.”

Live devnet balance

Every call logged

WHAT IT DELIVERS

Not a mockup — a working on-chain money loop.

—
100%

on-chain settlement of provable
markets

—
Real SOL

devnet stakes & payouts — actual
transfers, not points

—
Instant

calls placed live, during the match

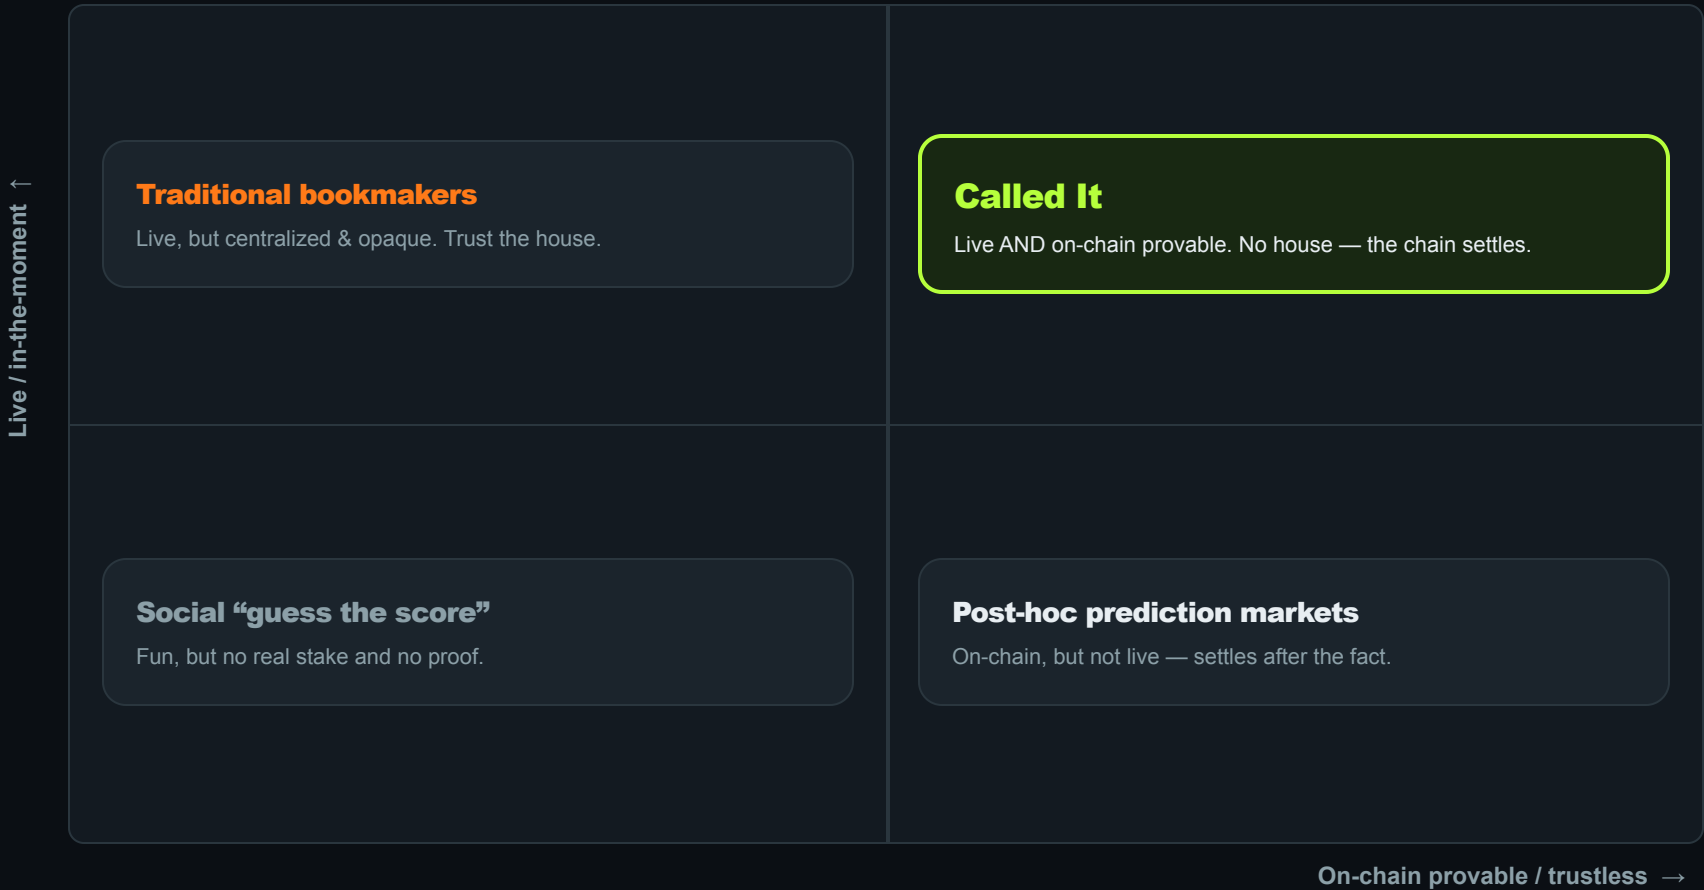

—
Verifiable

every stake carries a real tx hash +
block time

Proven end-to-end on Solana devnet — deploy green, live fixtures (Spain vs Argentina), real stake tx, prediction stamped, worker settling every 10s.

COMPETITIVE LANDSCAPE

Live and trustless is an empty quadrant — until now.

THE OPEN SPACE

Everyone owns one property.

Nobody owned **both** live and trustless — the top-right corner.

Called It sits there alone.

Only Called It is live and trustless — you call it, the chain proves it.

MARKET & SCALE

Start at the World Cup. Replicate to every live stat feed.

FIFA World Cup 2026

104 matches · billions of live viewers · the launch moment

Any football league

domestic leagues run year-round — the same markets, always on

Any live sport & stat

basketball, tennis, esports — anything with a live stat feed

WHY IT SCALES

- Markets are feed-driven — add a sport by adding a feed, not rebuilding the app.
- Settlement logic is generic over any provable stat (goals, corners, points...).
- On-chain rails mean no per-market banking, licensing bottleneck, or house float.
- Mobile-first PWA — no app-store gate, instant global reach.

A real pipeline — signed, verified, settled, and open.

Solana devnet

Phantom signs real devnet SOL stakes; the backend verifies each tx on-chain before stamping the prediction.

TxODDS TxLINE feed

Live match events ingested over SSE into feed_events — the source of truth for what actually happened.

TxOracle validate_stat

An Anchor program cross-checks the settling stat on-chain (advisory) before a market pays out.

Open & verifiable

Every stake carries its tx hash + block time. Anyone can audit any outcome on the public explorer.

ROADMAP

Devnet demo today → mainnet → every live market.

NOW

Devnet demo

- Live World Cup fixtures
- Real SOL stakes & payouts
- Goal / corner / card markets
- Settlement worker + on-chain proof

NEXT

Mainnet & polish

- Mainnet-beta with USDC option
- More markets per match
- Odds/multipliers tuning
- Wallet UX + onboarding

LATER

Multi-sport platform

- More sports via new feeds
- Social & leaderboards
- Creator-defined markets
- Liquidity & risk engine

Legally aware, technically proven, operationally lean.

Legal

- Framed as a skill-based, free-to-play game on devnet — no real-money gambling.
- On-chain settlement is transparent and auditable by design.
- Jurisdiction-aware rollout planned before any mainnet real-money launch.

Technical

- Full loop already runs end-to-end: stake → verify → stamp → settle → pay.
- Feed-driven, generic settlement — new markets/sports without a rewrite.
- Standard, well-supported stack: Solana, Fastify, Postgres, React.

Operational

- Serverless-friendly deploy on Railway; worker loop is cheap to run.
- No house float or per-market banking — on-chain rails carry the money.
- Small surface, mobile-first PWA — fast to iterate and ship.

TEAM

Built end-to-end for the Solana World Cup 2026 Hackathon.

Called It

A full-stack build across the API $\rightleftharpoons$ chain $\rightleftharpoons$ feed boundary:

Solana on-chain integration · TxODDS live-feed ingestion · settlement engine · Fastify + Postgres backend · React 19 PWA — designed, built, and shipped to a live devnet demo.
